

Lecture 12 - Display, Position aur Units

1. Display Property

display batati hai ek element page pe kaise behave karega: kitni jagah lega aur doosron ke saath kaise interact karega.

Value	Behaviour	width / height	Margin / padding
block	Poori available width leta hai, content chahe kitna bhi chhota ho. Nayi line pe aata hai.	Kaam karte hain	Sab properly kaam karte hain
inline	Sirf content jitni jagah leta hai, zyada nahi. Same line pe rehta hai.	Kaam nahi karte	Left/right kaam karte hain, top/bottom properly nahi
inline-block	Inline ki tarah same line pe rehta hai, par block ki tarah size-properties bhi maanta hai.	Kaam karte hain	Sab properly kaam karte hain

Kyun inline-block? Inline ka problem: width/height kaam nahi karti. Block ka problem: har cheez nayi line pe aati hai. **inline-block dono ka solution hai.**

2. Position Property

Value	Matlab	Top/left/right/bottom
static	Default position of an element.	Accept nahi karta
relative	Element ko uski normal position ke relative rakhta hai.	Kaam karte hain (normal position se move)
absolute	Element ko document flow se hata deta hai aur nearest ancestor ke relative rakhta hai jiski position set ho (relative, absolute ya fixed).	Kaam karte hain
fixed	Flow se hata deta hai aur viewport ke relative rakhta hai. Page scroll hone par bhi apni jagah rehta hai.	Kaam karte hain
sticky	Scroll position ke hisaab se relative aur fixed ke beech switch karta hai.	Kaam karte hain

```
position: relative; /* ya static | absolute | fixed | sticky */
top: 10px;
left: 20px;
```

3. Units

Lecture mein focus: **px**, **%**, **vh**, **vw** (table mein rem aur em bhi diye gaye hain).

Unit	Sub-type	Dynamic scaling?	Standard use case
px	Absolute	No	Precise borders, thin dividers, static sizes
rem	Relative	Yes (via root font)	Accessible typography, structural padding, margins
em	Relative	Yes (via parent font)	Content-specific spacing tied directly to local text size
%	Relative	Yes (via parent box)	Fluid grid widths and flexible layout columns
vw / vh	Relative	Yes (via browser window)	Full-screen hero sections, landing split layouts

Quick Revision

- **block**: poori width, nayi line | **inline**: content jitni, same line, width/height nahi | **inline-block**: same line + width/height
- **static** default | **relative** normal position se | **absolute** nearest positioned ancestor se | **fixed** viewport se | **sticky** relative + fixed
- **px** fixed size | **%** parent ke hisaab se | **vw / vh** browser window ke hisaab se | **rem** root font | **em** parent font
