

Orientation Class (Lecture 01) — Coding & Web Development

By - Nishant Sir | PW Earners

1. Full Stack Web Development kya hai?

Web development ke 3 main parts hote hain:

- **Frontend** - jo user ko dikhta hai (design, UI)
- **Backend** - jo peeche server pe logic/processing karta hai
- **Database** - jahan data store hota hai

Jab koi developer teeno cheezein (Frontend + Backend + Database) handle kar sakta hai, use **Full Stack Developer** kehte hain.

2. Frontend vs Backend — Example se samjho

Example 1: Instagram / YouTube

- **Frontend** → Insta, YouTube ka jo interface dikhta hai (videos, reels, likes, comments)
- **Backend** → Instagram ka username system, reels, Google jaisi cheezein process karna
- Backend flow: **YouTube** → "How to make website?" → **Frontend** banta hai using **Backend message processing** → **Database** se reply aata hai

Example 2: Restaurant Analogy (Best Example)

Restaurant ke through samjho pura system:

Restaurant Part	Web Dev Part
Table (jaha customer baithta hai)	Frontend
Kitchen (jaha khana banta hai)	Backend
Store (jaha raw material rakha hai)	Database

Flow: Customer Frontend (table) pe order deta hai (Pasta) → Backend (kitchen) usse process karta hai → Database (store) se ingredients leta hai → wapas Backend banata hai → Frontend pe serve hota hai.

Frontend + Backend + Database = **Full Stack**

3. Developer Roles

- **Frontend Developer** → sirf UI/design side pe kaam karta hai
 - **Backend Developer** → server-side logic + Database handle karta hai
 - **Full Stack Developer** ✅ → Frontend + Backend dono (best/complete role)
-

4. MERN Stack

Sabse popular full stack technology stack:

Letter	Technology	Kaam
M	MongoDB	Database
E	Express.js	Backend
R	React	Frontend
N	Node.js	Backend

5. Websites ke Types

a) Static Website

- Sab users ko **same content** dikhta hai
- Example: Restaurant website, Business website
- Content generally fix rehta hai

b) Dynamic Website

- Different users ko **different content** milta hai
 - Example: Instagram, YouTube
 - Aaj ke time 80-90% websites dynamic hoti hain
-

6. Project Banana Kyu Zaroori hai?

Project banane se:

- **Learning** badhti hai
- **Skill** improve hoti hai
- Example feature: Chatting jaisa system

Course complete hone ke baad career ke 3 options:

1. **Job**
 2. **Freelancing**
 3. **Startup**
-

7. Job Apply Karne ke Liye Chahiye (Code X)

- Resume
 - Website (portfolio jaisa) — Job Apply ke liye
 - Link, Email
 - Discussion
-

8. Course Roadmap

Foundation Stage

- **HTML, CSS, JS** → website ka base
- **Tailwind & Bootstrap** → styling frameworks
- **Git & GitHub**
 - Git = version control **tool** (laptop pe install karna hoga)
 - GitHub = code **upload/host** karne ki jagah
- **Google Drive** basics (photo, video, PDF, doc handle karna)
- Coding ke basics + Projects banate jaana

Frontend Advanced

- **React** — components based UI (jaise like/comment section wale boxes)

Advanced/Backend Stage

- **Backend:** Node.js, Express.js
- **Database**
- **Fullstack Project** banana

Extra Advanced Topics

- AWS (cloud/hosting)
- Docker
- CI/CD
- WebSocket (real-time communication)

Next.js

- Frontend + Backend dono handle karne wala framework
-

Quick Summary Table

Concept	One-liner
Frontend	UI jo user dekhta hai
Backend	Server ka logic/processing
Database	Data storage
Full Stack	Frontend + Backend + DB sab
MERN	MongoDB, Express, React, Node.js
Static Website	Sabko same content
Dynamic Website	Har user ko alag content
Career Paths	Job / Freelancing / Startup
